

# Session 3:

# Querying Attribute Data and Spatial Selection

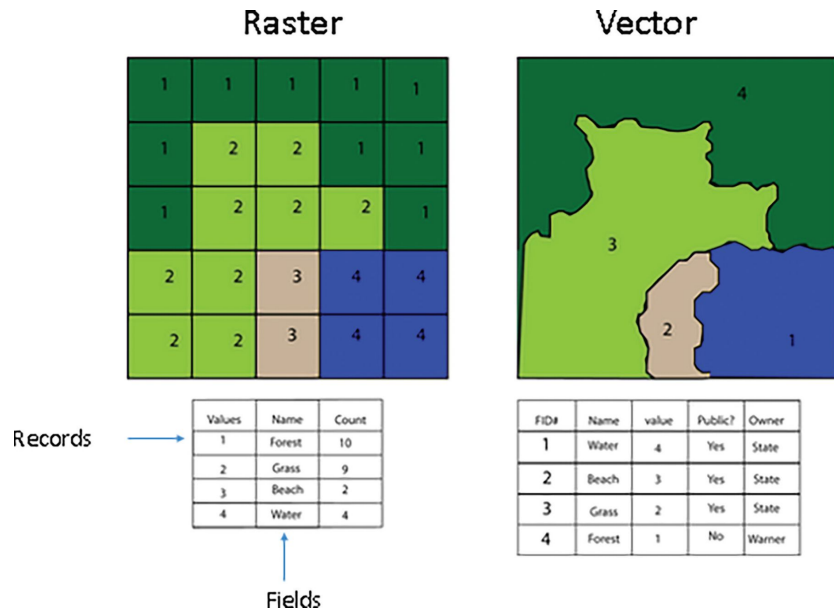

Randy Bucciarelli  
randobucci@gmail.com

# Class Schedule

Monday	Tuesday	Wednesday	Thursday	Friday
<p>08/05/19</p> <p><b>Introduction to Geographical Information Systems</b></p> <p>10:45 am–12:15 am</p>	<p>08/06/19</p> <p><b>Cartography and Spatial Data Display</b></p> <p>8:30am – 11:00pm</p>	<p>08/07/19</p> <p><b>Querying Data for Spatial &amp; Attribute Selections</b></p> <p>8:30am – 11:00pm</p>	<p>08/08/19</p> <p><b>Data Formats for GIS</b></p> <p>8:30am – 11:00pm</p>	<p>08/09/19</p> <p><b>Map Projections and Coordinate Systems</b></p> <p>8:30am – 11:00pm</p>
<p>08/12/19</p> <p><b>Editing and Storing Spatial and Attribute Data</b></p> <p>8:30am – 11:00pm</p>	<p>08/13/19</p> <p><b>Spatial Data Analysis Tools</b></p> <p>8:30am – 9:30 am</p> <p><b>Scripps Institute of Oceanography</b></p> <p>10:30am – 1:30pm</p>	<p>08/14/19</p> <p><b>Analysis Tools/Online Map Creation</b></p> <p>8:30am – 11:00pm</p>	<p>08/15/19</p> <p><b>Map Creation/ Geocoding</b></p> <p>8:30am – 11:00pm</p>	<p>08/16/19</p> <p><b>Geocoding/ Wrap up</b></p> <p>8:30am – 11:30am</p> <p><b>Closing Ceremony and Certificates</b></p> <p>12:00pm – 2:00pm</p>

# Outline: Querying Attribute Data and Spatial Selection

- Introduction
- Attribute tables
- Making queries
- Spatial selection
- Demonstration
- Project

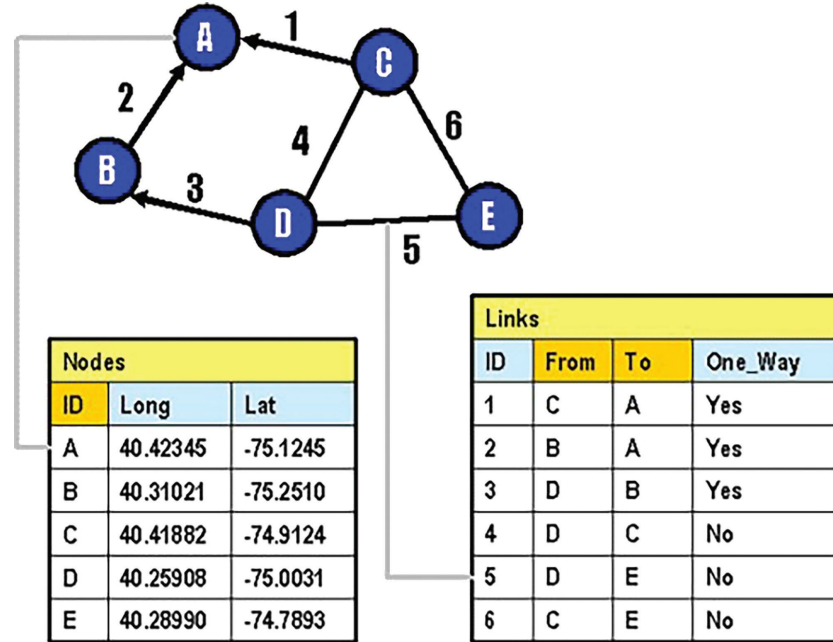

How spatial data are represented in GIS

How non-spatial data are represented in GIS

Source: GIS - An Introduction (McHaffie, 2019)

# Introduction

- Attribute tables
  - What are attribute tables?
  - How do we use them?
- Making queries
  - Query = Selection
- Spatial selection and proximity
  - Selecting spatial features
  - What is proximity?

Source: GIS - An Introduction (McHaffie, 2019)

# Attribute Tables

**Spatial data represented in a GIS is often split into two components:**

- **Coordinate information** (i.e. features) describing spatial geometry
- **Attribute information** (i.e. tabular data) representing the (mostly) non-spatial properties of object being mapped.

# Coordinates & Attributes

## REPRESENTATION AND DATA STRUCTURES

### Coordinates and Attributes

Coordinates:

- 1,8
- 3,12
- 8,10
- 14,5
- 5,1.5
- 1,8

Attributes:

- Lot #: 1347
- Street: Willow Lane
- Town: Hopkins

Source: GIS Fundamentals by P. Bolstad, 2015

# Spatial Attributes

One-to-one relationship  
between:

- Geographic features (point, line, or polygon)
- Records in a table

Name	FIPS	Pop90	Area	PopDn
Whatcom	53073	128	2170	59
Skagit	53057	80	1765	45
Clallam	53009	56	1779	32
Snohomish	53061	466	2102	222
Island	53029	60	231	261
Jefferson	53031	20	1773	11
Kitsap	53035	190	391	485
King	53033	1507	2164	696
Mason	53045	38	904	42
Gray Harbor	53027	64	1917	33
Pierce	53053	586	1651	355
Thurston	53067	161	698	231
Pacific	53049	19	945	20
Lewis	53041	59	2479	24

Source: GIS Fundamentals by P. Bolstad, 2015

# Attribute Data Types

Data types:

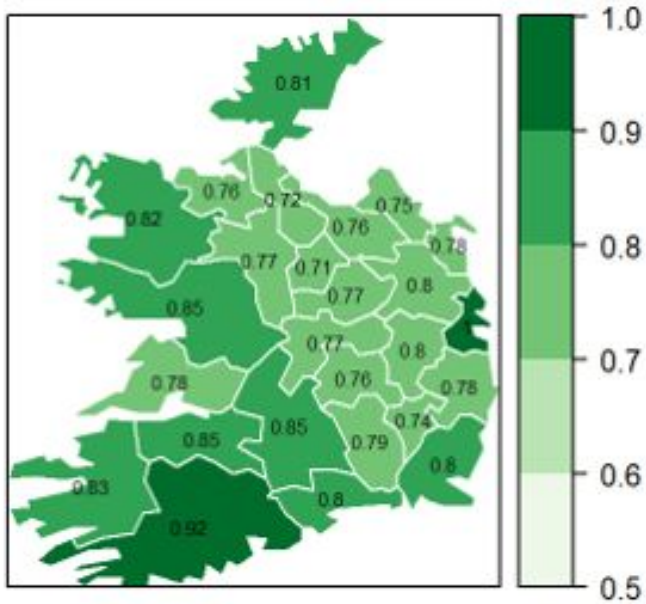

- Integer
- Float
- Double
- Text

Type	Stored values	Note
Short integer	-32,768 to 32,768	Whole numbers
Long integer	-2,147,483,648 to 2,147,483,648	Whole numbers
Float	-3.4 * E-38 to 1.2 E38	Real numbers
Double	-2.2E-308 to 1.8 E308	Real numbers
Text	Up to 64,000 characters	Letters and words

Source: GIS Fundamentals by P. Bolstad, 2015

# Choosing A Data Type

Source: <https://mgimond.github.io/Spatial/introGIS.html>

# Data Types: Example

## Table of Houses in Neighborhood

Object identifiers

OBJECTID	Rent	Type	Year_Built
1	900	Apartment	2011
2	1300	House	1956
3	600	Apartment	1989
4	2000	House	2000
5	2500	House	1998
6	1200	House	1964

Dates

Numbers

Text

# Attribute Query

**Query:** a selection of a subset of records based on the values of specified attributes.

# Querying Data

## Example: Housing facilities

You can use the attributes to learn more about the features.

Here, the selected feature is a house that costs \$1,300 a month in rent.

# Attribute Tables

## Attribute Field

OBJECTID	Rent	Type	Year built
1	900	Apartment	2011
2	1300	House	1956
3	600	Apartment	1989
4	2000	House	2000
5	2500	House	1998
6	700	House	1964

Type Is Equal To Apartment

## Attribute Value

OBJECTID	Rent	Type	Year built
1	900	Apartment	2011
2	1300	House	1956
3	600	Apartment	1989
4	2000	House	2000
5	2500	House	1998
6	700	House	1964

Type Is Equal To Apartment

## Operator

OBJECTID	Rent	Type	Year built
1	900	Apartment	2011
2	1300	<del>House</del>	1956
3	600	Apartment	1989
4	2000	<del>House</del>	2000
5	2500	<del>House</del>	1998
6	700	<del>House</del>	1964

Type Is Equal To Apartment

# Query Features

A Query requires 3 things:

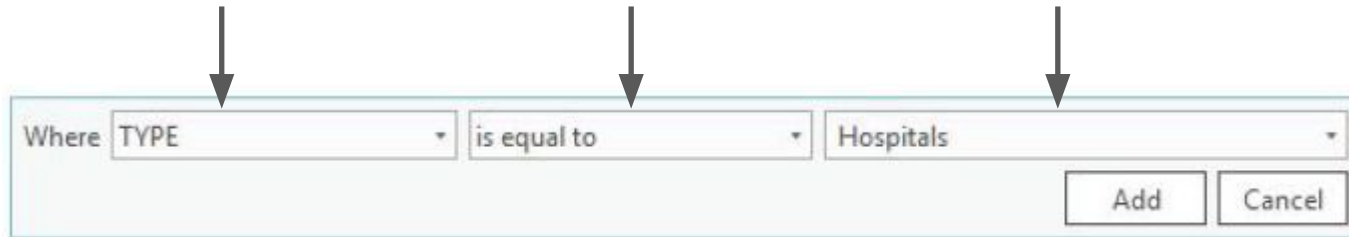

1. Attribute Field
2. Operator
3. Attribute Value

**\*\* A Query is called a  
“Clause” in ArcGIS Pro**

Attribute Field: Type

Operator: Is Equal To

Attribute Value: Hospitals

The screenshot shows a query builder interface with three dropdown menus. The first dropdown is labeled 'Where' and contains the text 'TYPE'. The second dropdown is labeled 'is equal to'. The third dropdown is labeled 'Hospitals'. Below these dropdowns are two buttons: 'Add' and 'Cancel'. Three arrows point from the text labels above to the respective dropdown menus.

Where	TYPE	is equal to	Hospitals	Add	Cancel
-------	------	-------------	-----------	-----	--------

# Table Operations (1-4)

Restrict (query) –  
subset by rows

Project – subset by  
columns

Product – all possible  
combinations

Divide – inverse of  
product

a) restrict

ID	type	color	size	age
1	a	blue	big	old
2	c	green	big	young
3	a	red	small	mid
4	d	black	big	older
5	x	mauve	tiny	oldest
6	g	dun	huge	young
7	c	ecru	small	mid

restrict →

ID	type	color	size	age
1	a	blue	big	old
4	d	black	big	older
6	g	dun	huge	young
2	c	green	big	young

b) project

ID	type	color	size	age
1	a	blue	big	old
2	c	green	big	young
3	a	red	small	mid
4	d	black	big	older
5	x	mauve	tiny	oldest
6	g	dun	huge	young
7	c	ecru	small	mid

project →

ID	color	size
1	blue	big
2	green	big
3	red	small
4	black	big
5	mauve	tiny
6	dun	huge
7	ecru	small

c) product

No.	Dir.
1	N
2	S

product

App.
Yes
Yes
No

→

No.	Dir.	App.
1	N	Yes
2	S	Yes
1	N	No
2	S	No

d) divide

type
m
n
r

divide by

size
1
2

per

type	size
m	1
m	2
m	3
m	4
n	2
r	1
r	3

→

type
m

# Table Operations (5-8)

Union – combine top to bottom

a) union

ID	type	color	size	age
1	a	blue	big	old
6	g	dun	huge	young

→ union →

ID	type	color	size	age
1	a	blue	big	old
4	d	black	big	older
6	g	dun	huge	young
2	c	green	big	young

Intersect – row overlap

b) intersect

ID	color	size
1	blue	big
2	green	big
3	red	small
4	black	big
5	mauve	tiny
6	dun	huge
7	ecru	small

→ intersect →

ID	color	size
1	blue	big
5	mauve	tiny

Difference – row non-- overlap

c) difference

ID	color	size
1	blue	big
2	green	big
3	red	small
4	black	big
5	mauve	tiny
6	dun	huge
7	ecru	small

→ difference →

ID	color	size
2	green	big
3	red	small
4	black	big
6	dun	huge
7	ecru	small

Join (relate) – combine by a key column

d) join

ID	type
1	a
2	b
3	b
4	a

→ join →

type	color	size	age
a	blue	big	old
b	dun	tiny	old

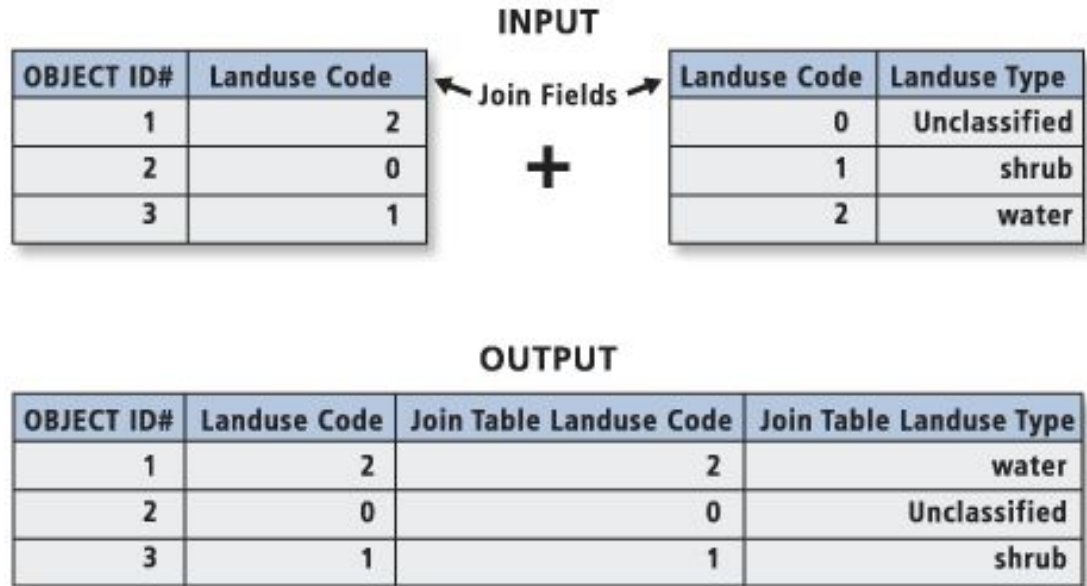

→ join →

ID	type	color	size	age
1	a	blue	big	old
2	b	dun	tiny	old
3	b	dun	tiny	old
4	a	blue	big	old

# Table Join

- Joins a table to another table based on a common field.
- Appends attributes of a source table to the end of a target table

Source: ArcGIS Pro Documentation

# Table Join Questions

Answering the following questions will help you use table join properly:

- Do the two tables share the same attribute values?
- Are those common attributes of the same data types?
- What is the relationship between the two tables?
- In what direction should you perform table join?

# Table Join Exercise

- Presence of common attribute
- Data type of common key
- Relationship between tables
- Direction of table join

TRI

TRI_ID	Toxic	zipcode
1	25354	60001
2	3422	60001
3	253	60002
4	345	60002

Cancer

zipcode	cancerrt
60001	3.4
60002	1.4

TRI+Cancer if you join Cancer (one-side) to TRI (many-side)

TRI_ID	Toxic	zipcode	cancerrt
1	25354	60001	3.4
2	3422	60001	3.4
3	253	60002	1.4
4	345	60002	1.4

Cancer+TRI if you join TRI (many-side) to Cancer (one-side)

zipcode	cancerrt	TRI_ID	Toxic
60001	3.4	1? 2?	25354? 3422?
60002	1.4	3? 4?	253? 345?

# Building Query Expressions

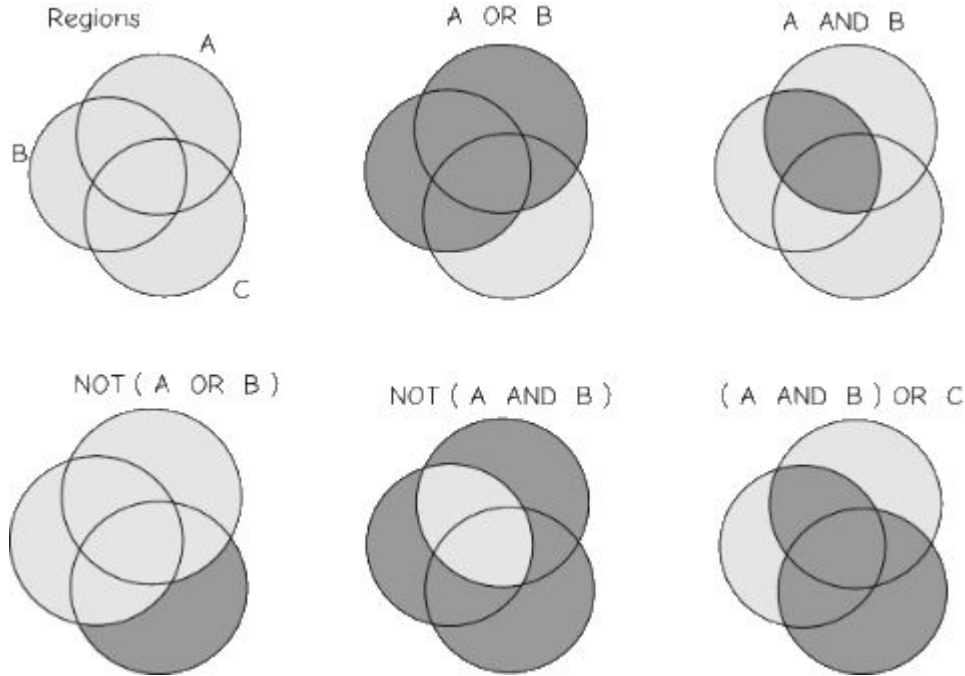

## Set Algebra:

- o Less than (<)
- o Greater than (>)
- o Equal to (=)
- o Not Equal to (<>)

## Boolean Operators:

- o **AND** combinations decrease number of records in selected set
- o **OR** combinations typically increase number of records
- o **NOT** is negation operator meaning “select those records that do not meet the following condition”.

# Boolean Algebra Schematic

Examples of  
Boolean Algebra  
combining the  
operators AND, OR,  
NOT.

Source: GIS Fundamentals by Bolstad, 2015.

# Query - AND Example

Simple selection:

records with Area > 20.0

ID	Area	Landuse	Municip
1	10.5	Urban	City
2	330.3	Farm	County
3	2.4	Suburban	Township
4	96.0	Suburban	County
5	22.1	Urban	City
6	30.2	Farm	Township
7	4.4	Urban	County

AND selection:

records with (Landuse = Urban) AND  
(Municip = City)

ID	Area	Landuse	Municip
1	10.5	Urban	City
2	330.3	Farm	County
3	2.4	Suburban	Township
4	96.0	Suburban	County
5	22.1	Urban	City
6	30.2	Farm	Township
7	4.4	Urban	County

# Query – OR & NOT Example

OR selection:  
records with (Area > 20.0)  
OR (Municip = City)

ID	Area	Landuse	Municip
1	10.5	Urban	City
2	330.3	Farm	County
3	2.4	Suburban	Township
4	96.0	Suburban	County
5	22.1	Urban	City
6	30.2	Farm	Township
7	4.4	Urban	County

NOT selection:  
records with  
Landuse NOT Urban

ID	Area	Landuse	Municip
1	10.5	Urban	City
2	330.3	Farm	County
3	2.4	Suburban	Township
4	96.0	Suburban	County
5	22.1	Urban	City
6	30.2	Farm	Township
7	4.4	Urban	County

# Query - Complex Selection

Complex selection:  
records with [(Landuse = Urban) AND (Mill Rate = B)] OR  
{NOT(Municip = City) AND (Density > 200)}

ID	Area	Landuse	Municip	Density	Mill Rate
1	10.5	Urban	City	1,112.2	A
2	330.3	Farm	County	1.9	C
3	2.4	Suburban	Township	237.5	C
4	96.0	Suburban	County	98.1	A
5	22.1	Urban	City	916.2	B
6	30.2	Farm	Township	3.7	A
7	4.4	Urban	County	153.8	D

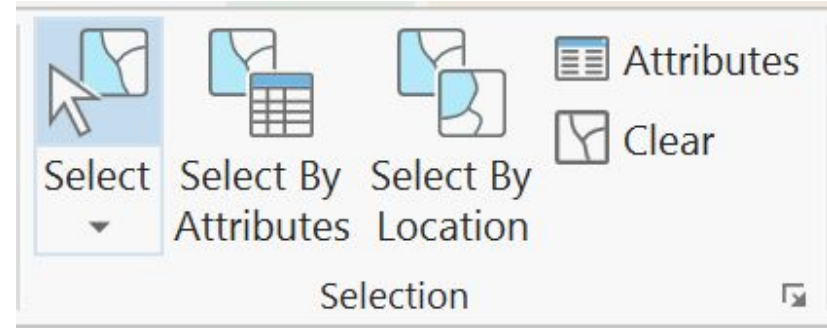

# Query: Visual Check

# Selection/Query in ArcGIS Pro

Two main tools:

1. Select Layer By Attribute
2. Select Layer By Location

# Select Layer By Attribute

The screenshot displays a GIS application interface. On the left, a map window titled 'Map' shows a dark-themed map with numerous purple points and a cluster of cyan points. The bottom status bar indicates a scale of 1:6,864,125, coordinates 120.6257319°W 47.7093206°N, and 61 selected features.

On the right, the 'Geoprocessing' panel is open, showing the 'Select Layer By Attribute' tool. The 'Parameters' tab is active. The 'Input Rows' dropdown is set to 'Health Care Facilities'. The 'Selection type' is 'New selection'. The 'Expression' section shows two clauses: 'Where TYPE is equal Hospitals' and 'And FLU CASES is greater 70'. The 'SQL' toggle is turned on. A 'Run' button is at the bottom right of the panel.

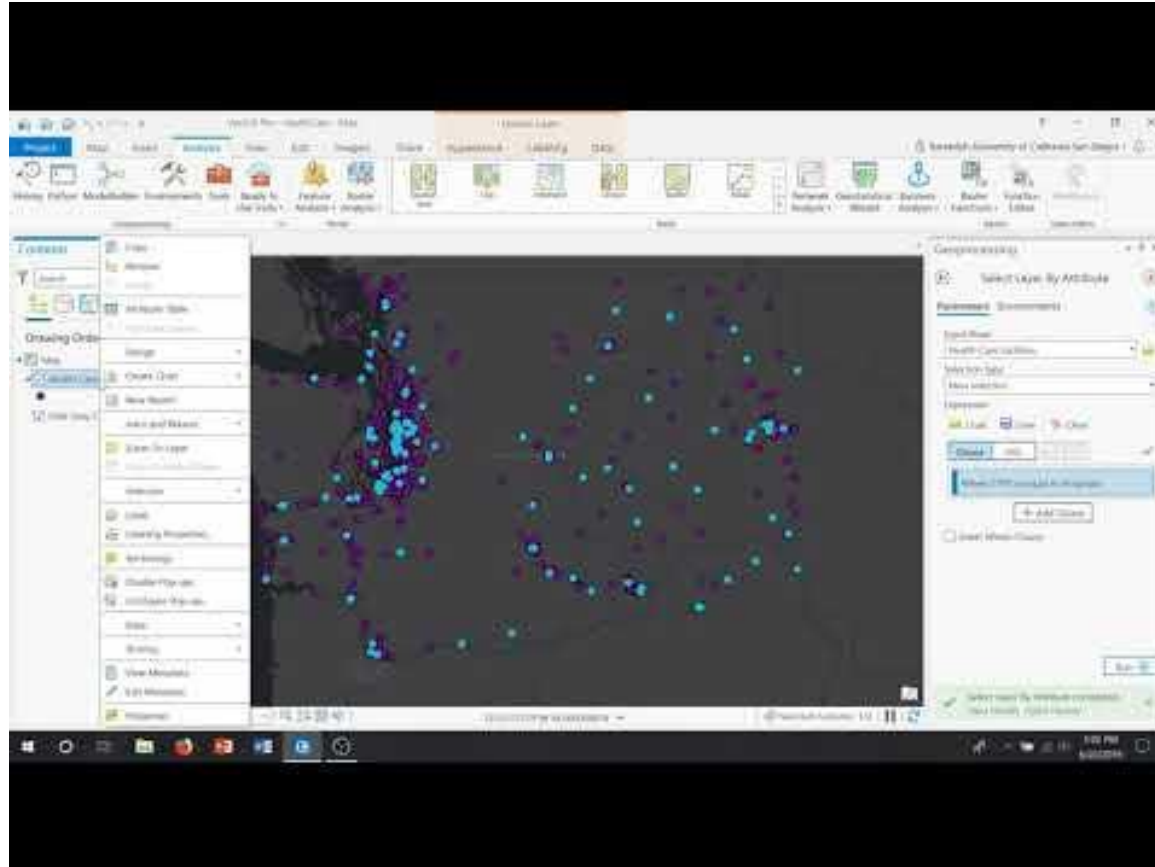

A green status bar at the bottom of the Geoprocessing panel indicates: 'Select Layer By Attribute completed. View Details Open History'.

# Video: Select By Attributes

Please check out the video by Paul Bolstad:

[Select By Attributes](#)

# Demo: Select By Attributes

# Outline: Querying Attribute Data and Spatial Selection

- Introduction
- Attribute tables
- Making queries
- Spatial selection
- Demonstration
- Project

# Spatial Selection

- **Spatial Query:** Identifying features based on spatial criteria.
- Results are either highlighted on screen or written to new data layer
- Criteria include: **Adjacency** or **Containment**

# Spatial Set Algebra

Attribute query  
resulting in:  
spatial selections  
(shaded features)

# Selection: Boolean and Set Algebra

Select counties with  
large senior citizen  
population

population 65+ > 15%

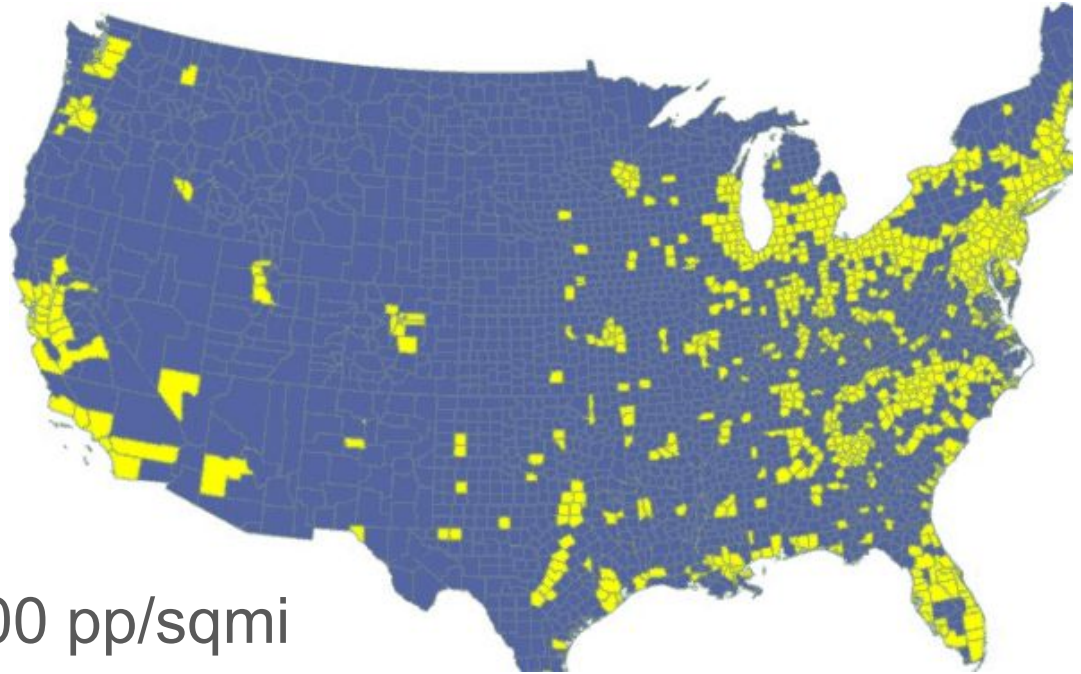

Source: GIS Fundamentals by Bolstad, 2015.

# Selection: Boolean and Set Algebra

Select counties  
with large  
population  
density

population density  $> 100$  pp/sqmi

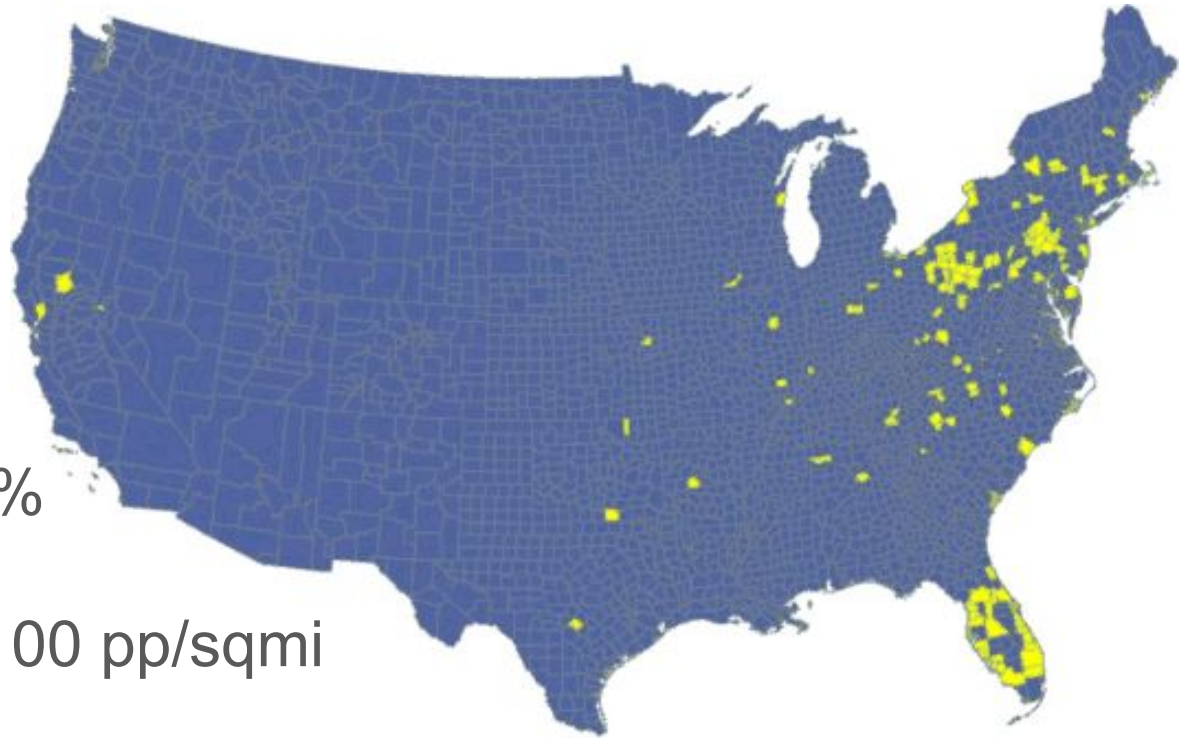

Source: GIS Fundamentals by Bolstad, 2015.

# Selection: Boolean and Set Algebra

Where are the  
most senior  
citizens in the  
country?

population 65+ > 15%  
**AND**  
population density > 100 pp/sqmi

Source: GIS Fundamentals by Bolstad, 2015.

# Proximity Analysis

- **Proximity analysis** compares, calculates, and shows distances between features
- **Proximity tools:**
  - Locate nearest features
  - Calculate distances between features
  - Generate distance buffers
- **Located in Proximity toolset**

# Spatial Selection: Adjacency

How do we define  
**“Adjacency”**?

- A feature is adjacent if it shares a border.
- How you define a shared border is important.

# Adjacency Example

Example of 4 Corners USA:

- Is Colorado Adjacent to Arizona?

Adjacency  
- shared line required

Adjacency  
- shared node or line required

# Spatial Selection: Containment

- **Containment Selection** identifies all features that contain or surround a set of target features.
- Example: Which states contain some portion of the Mississippi River?

Source: GIS Fundamentals by Bolstad, 2015.

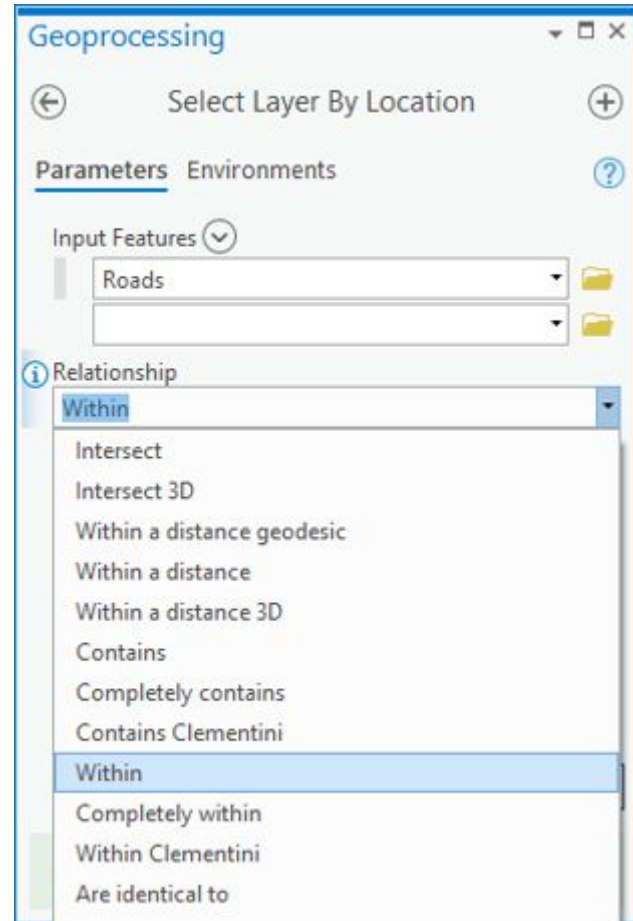

# Select Layer By Location

Many Options:

- Intersect
- Within a distance
- Contains
- Within

Refer to [ArcGIS Documentation](#)

# Intersection

- Select features that overlap or touch source layer
- Point, Line, or Polygon

When finding features that intersect with point features

When finding features that intersect with line features

When finding features that intersect with polygon features

Source: Essentials of GIS by J. Cambell, 2011.

# Within Distance Of

- Specify some distance value
- Source layer is buffered
- All features intersecting buffer are highlighted in target layer

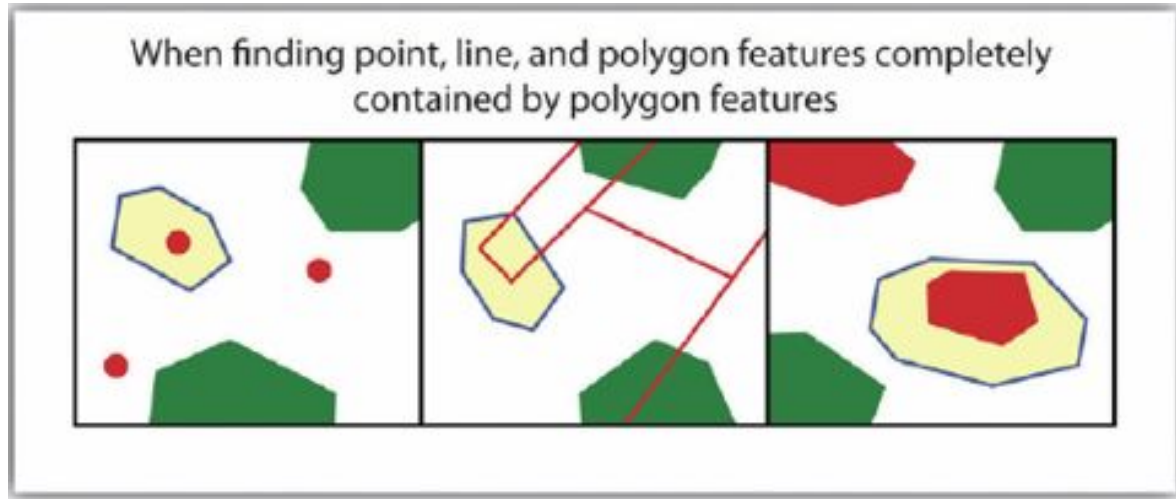

The highlighted blue and yellow features are selected because they **are within a distance of** the red features.

Source: Essentials of GIS by J. Cambell, 2011.

# Completely Contain

- Select features that are entirely within the source layer
- Features with coincident boundaries are not selected

The highlighted blue and yellow features are selected because they **completely contain** the red features.

Source: Essentials of GIS by J. Cambell, 2011.

# Completely Within

Select features in target layer whose entire spatial extent occurs within geometry of source layer

The highlighted blue and yellow features are selected because they are **completely within** the red features.

Source: Essentials of GIS by J. Cambell, 2011.
